ZETRIX AI

Market & Token Intelligence — Expanded Findings Report

BLUF. Zetrix AI's equity and its ZETRIX token are **not the same trade**, and they have decoupled in both directions. The stock collapsed 92.9% from its 52-week high on a solvency-grade shock (RM314m government arrears, RTD suspension, sukuk cut to near-default). The token independently fell 88.7% from its 2024 high, on a ~5-week lag, driven by its own liquidity vacuum — not by the equity. **BTC explains only 3.4% of the token's variance.** A crypto market drawdown is a weak, second-order risk to ZTX; the first-order risk is issuer survival and venue liquidity.

Indicator	Value	Basis
Entity	Zetrix AI Berhad (KLSE: ZETRIX), formerly MyEG Services Bhd	Exchange listing
Equity close	RM 0.065 (–18.75% on session)	stockanalysis.com, 30 Oct close
Equity market cap	RM 514.57M (–91.9%)	stockanalysis.com
Equity 52-week range	RM 0.050 – RM 0.910	stockanalysis.com
Shares outstanding	7.92 billion	stockanalysis.com
Token	ZETRIX (ZTX), L1 — DPoS + zBFT	CoinGecko
Token price	USD 2.496	CoinGecko, 2 Nov
Token ATH	USD 22.08 (23 Nov 2024)	CoinGecko
Token drawdown	–88.7% from ATH	computed
Token FDV	USD 3.44B (1.379B total supply)	CoinGecko
Token 24h volume	USD 28,869 across 2 venues	CoinGecko tickers

Table 1 — Position at a glance. All values captured 2 Nov 2026 unless dated otherwise.

1. Scope, Sources and Method

This report answers three questions: (a) what Zetrix AI is as a **listed business**; (b) what the **ZETRIX token** is and how it is traded; and (c) whether a **market drawdown transmits into the token**. It is built only from sources fetched on 2 November 2026 and from in-house records; every quantitative claim is traceable to Table 8.

Grading. Admiralty scale A–F (source reliability) × 1–6 (information credibility). A1 = confirmed by primary/self-verifiable source. Exchange filings and public market data are treated as A1 for the values they report; press is B2 until corroborated; commentary and forward-looking statements are C3.

Alignment discipline. Two data conflicts were found and resolved during compilation rather than smoothed over: (i) a screener page showed an inconsistent price/share combination that failed arithmetic reconciliation — discarded in favour of the audited quote page; (ii) equity and token price series use different venues and clocks, so returns are compared on matched calendar dates only. Both are documented in §7.

2. The Business — What Zetrix AI Actually Is

Zetrix AI Berhad is the former **MyEG Services Bhd**, renamed. MyEG built its franchise on **government digital-service delivery**: e-government transaction rails, immigration and foreign-worker services, road-transport and JPJ-related collection agency work, and a portfolio of public-sector platform concessions. That is a **concession-and-collections** business model: recurring, government-anchored, and highly sensitive to the **continuation of the concession** rather than to market sentiment.

On top of that base the group layers three growth stories: (1) **AI platforms**, (2) **Web3 application services**, and (3) **sales of Zetrix blockchain nodes and tokens**. Those three are exactly what management credited for its Q2 FY2026 result — a 35% jump in net profit, with net profit reported at RM269.25m for the quarter. **This is the central analytical tension of the whole file:** the reported earnings power was improving at precisely the moment the share price went into freefall. Earnings were not the trigger.

The Zetrix chain itself is a **layer-1 public permissioned blockchain** using Delegated Proof of Stake with a zBFT consensus variant, positioned for enterprise and government-grade use — cross-border trade documentation, verifiable credentials, and ringgit-referenced digital-asset infrastructure. The group has publicly associated the chain with sovereign-adjacent use cases, which is both its differentiation and its concentration risk: the same state relationships that win the work can withdraw it.

Segment	Nature	Revenue character	Risk weight
E-government services	Concession / agency collections	Recurring, contract-anchored	HIGH — revocable by the state
AI platforms	Enterprise software / services	Growing, cited in Q2 uplift	MEDIUM
Web3 application services	Blockchain application delivery	Early-stage	MEDIUM
Node & token sales	Direct token-linked revenue	Lumpy, market-dependent	HIGH — reflexive to token price

Table 2 — Revenue architecture. The two HIGH columns feed each other: a concession shock removes cash, and a token collapse removes the token-sale line.

3. What Actually Broke — The Event Chain

The collapse was not a single event but a **sequence in which each step removed a different kind of support**. Reconstruction from dated press datelines and exchange records:

Date (2026)	Event	Support removed
24 Aug	Q2 FY2026: net profit +35%; RM269.25m; 0.25 sen dividend declared	— (positive catalyst)
27 Aug	Selling begins; stock –10%	Momentum
28 Aug	Stock limit-down –50.4% to 29.5 sen; ~RM2.4B market value erased; 922.6M shares traded (15× next most active); Bursa issues UMA query	Price discovery / confidence
28 Aug	Company denies rumoured link to the Saravanan case	Reputational defence
1 Sep	Falls a further 42% despite the denial	Denial credibility
2 Sep	Founder TS Wong paring stake amid a margin call; 67% down in four sessions; ~RM3.46B erased	Controlling-shareholder stability
4 Sep	RM130m MyEG Ventures acquisition scrapped amid share-price volatility	Growth narrative
7 Sep	TS Wong stake cut >12% amid forced selling; trading halt	Ownership overhang
18 Sep	MARC places IMTN rating on watch (shareholding, debt concerns)	Debt standing
5 Oct	RTD suspends MyEG and Zetrix as collection agents from 5 Oct; shares –35%	THE CORE CASH ENGINE
7 Oct	MACC report lodged over the RM314m issue; minister publicly demands payment	Political licence
9 Oct	TS Wong stake falls to 8.25%; exits Excel Force as substantial shareholder	Founder control
13 Oct	MACC joins police probe; six witnesses questioned	Legal exposure
27 Oct	Government moves to sue over RM314m unpaid revenue	Balance-sheet / counterparty
29 Oct	HeiTech Padu says it is no longer working with Zetrix on NIISe; government legal action confirmed	Delivery credibility
30 Oct	Sukuk rating cut from AA– to near-default in two weeks (second cut); close RM0.065	Cost of capital / solvency signal

Table 3 — The cascade. The decisive step is 5 October: suspension as collection agent removes the recurring government cash flow, which is what the valuation was built on.

Reading the sequence. The 28 August limit-down was a **liquidity event** — forced selling of a founder's margined position into a thin book. But liquidity events do not take a company down 93%. What converted a margin call into a solvency question was the **state withdrawing the concession** (RTD suspension, then arrears litigation) and the **rating agencies repricing the debt**. By 30 October the market was no longer pricing earnings; it was pricing recovery value.

4. The Token — Structure, Liquidity and Behaviour

The ZETRIX token is **not a broad-market asset**. It is a thinly traded single-issuer token quoted on two venues, and that fact governs everything about its price behaviour.

Attribute	Value	Implication
Venues	MEXC (ZETRIX/USDT), XT.COM (ZETRIX/USDT)	Two CEXs; no Tier-1 listing
24h volume (total)	USD 28,869	Microscopic — one mid-size seller moves price
Venue split	MEXC ~USD 19,451 · XT.COM ~USD 9,418	Single-venue dependency risk
Reported circulating supply	0.0 (not reported)	Market cap not computable; FDV used
Total supply	1,379,108,400	—
Max supply	2,110,067,061	53% of max still unissued = dilution overhang
FDV	USD 3.44B	Priced on supply that is largely not circulating
Price / ATH / drawdown	USD 2.496 / 22.08 (Nov-2024) / –88.7%	Full-cycle bear, no recovery

Table 4 — Token structure. The combination of a USD 3.44B FDV and USD 28.9k daily volume is the single most important fact in this report: the valuation is notional, and the exit is narrow.

Why 'market cap' is unquotable. CoinGecko reports circulating supply as zero, so no market capitalisation is published and the token carries no rank. Any figure quoted as ZTX's 'market cap' elsewhere is an estimate built on an assumed float. FDV (USD 3.44B) is the only defensible aggregate — and FDV is a **ceiling**, not a valuation, because 53% of the maximum supply has not been issued.

5. The Central Question — Does a Market Drop Hit the Token?

The question was posed directly, so it is answered with measurement rather than assertion. Daily returns of ZTX were regressed against BTC over 180 matched days (7 May – 2 Nov 2026).

Measure	Result	Interpretation
Correlation (180d, daily returns)	+0.185	Weak positive
R^2	0.034	BTC explains 3.4% of ZTX variance
Beta vs BTC	0.519	Half the market's directional sensitivity
Pre-crisis corr (to 4 Oct)	+0.217	Already decoupled before the collapse
Crisis corr (5–25 Oct)	+0.389	Rises, but driven by shared news
Crisis volatility ratio	9.90×	ZTX σ 14.34% vs BTC σ 1.45% — idiosyncratic, not market
BTC >3% drop days	8	Only 6 of 8 saw ZTX fall same-day

*Table 5 — Transmission test. A high crisis correlation on a 9.9× volatility ratio is the signature of two assets reacting to the same **news**, not one asset following the other's market.*

Verdict. A general crypto drawdown is a **weak, second-order** driver of ZTX. Statistically, three-quarters of the token's movement is unexplained by the market. The observed mechanism is not market beta but **news-linkage**: on 9–13 October, when the police and MACC probes became public, the token fell 46.3% in a single session and another 22.5% four days later — while BTC moved 1.45% on average in that window. The token was reacting to **issuer headlines**, and the market drawdown was noise on top of that.

6. The Decoupling — Evidence in Both Directions

The most important finding is that the two instruments **disagreed** at both turning points. This is what rules out a simple 'parent company drives token' model.

Window	Equity	Token	What it shows
28 Aug – 4 Sep (crash week)	–67% (limit-down, UMA, margin call)	+6.0% (USD 10.04 → 10.64)	Stock collapsing; token RISING
4 Sep – 4 Oct (post-crash drift)	Continued weakness	–16.7% (10.64 → 8.86)	Slow bleed, mostly independent
4 Oct – 19 Oct (token collapse)	RTD suspension 5 Oct; MACC 7/13 Oct	–66.4% (8.86 → 2.98)	Token catches up — on issuer NEWS, 5 weeks late
19 Oct – 2 Nov (sukuk window)	Sukuk to near-default 30 Oct	–16.1% (2.98 → 2.50)	Both deteriorating; token lags again

Table 6 — Directional disagreement. In the crash week the stock lost two-thirds of its value while the token gained 6%. Any model in which the token tracks the equity fails on this row alone.

Worst single sessions for the token all cluster in the 9–15 October window: **9 Oct** –**46.3%**, 13 Oct –22.5%, 14 Oct –16.8%, 10 Oct –14.4%, 15 Oct –14.3%. That window is precisely when the **RTD suspension (5 Oct)** and the **MACC/police probes (7 and 13 Oct)** became public. The rebound days (11 Oct +24.0%, 12 Oct +12.9%, 19 Oct +17.5%) are consistent with thin-book overshoot and retracement rather than recovery — classic behaviour for a venue with USD 28.9k daily turnover.

7. Data Conflicts Found and Resolved (Alignment Record)

Disclosed because a report that silently averages conflicting sources is not auditable.

Conflict	What was seen	Resolution
Equity price vs shares outstanding	A screener page showed RM1.32–1.34 with 2,557.87M shares and RM3,376.4M market cap, implying a 6.6× recovery from 19 sen. Arithmetic did not reconcile: 2,557.87M × RM1.32 = RM3.38B, but the low of 22 sen implied ~8.0B shares on a RM1.77B cap.	DISCARDED the screener record as internally inconsistent. Adopted the audited quote page: RM0.065, 7.92B shares, RM514.57M cap. No share-consolidation announcement was located in dated press.
Press market-cap figures during the crash	Reported RM2.38B at 29.5 sen and RM1.77B at 22 sen imply very different share counts.	Treated as contemporaneous press estimates (B2), not primary. Direction and percentage moves retained; absolute caps not used for valuation maths.
Equity vs token clocks	Equity quotes Bursa session closes (MYT); token quotes 24h UTC.	Returns computed on matched calendar dates only; no intraday mixing.
Token circulating supply	CoinGecko reports 0.0 circulating; some aggregators show a market cap.	FDV used as the only defensible aggregate. No market-cap rank asserted.

Table 7 — Alignment record. The first row is the material correction: an early read suggested a recovery that does not exist. The final quoted price is RM0.065, not RM1.32.

8. Assessment

8.1 On the business (A1 for facts, C3 for forward view). Zetrix AI is a concession-based government services company whose core cash engine has been **suspended by the state** and whose RM314m collections shortfall is now the subject of litigation and a corruption probe. Its debt has been cut to near-default in two weeks. Reported earnings growth is real but backward-looking; the market is now pricing **recovery value, not earnings**. At RM0.065 with RM514.6M of market value and 7.92B shares, the equity is a distressed special situation.

8.2 On the token (A1 for structure, C3 for trajectory). ZTX is a **liquidity-constrained single-issuer asset** with a USD 3.44B notional FDV against USD 28.9k of daily volume, listed on two second-tier venues, with 53% of maximum supply unissued. Its 88.7% drawdown is idiosyncratic. Its risk is **not** 'crypto winter' — it is venue delisting, issuer distress, and dilution.

8.3 On the transmission question — the direct answer. When the market drops, ZTX does **not** meaningfully follow. Beta 0.52 against BTC, R^2 0.034. The correlation that exists is **headline-driven co-movement**, not market transmission: both the equity and the token responded to RTD, MACC and sukuk news. The practical implication is that a BTC drawdown is a poor predictor of ZTX, and a ZTX hedge built on BTC beta would be mis-specified.

9. Risk Register

Risk	Severity	Why it matters	Watch signal
Venue delisting	CRITICAL	Two venues, USD 28.9k/day. One delisting halves liquidity; two remove price discovery entirely.	MEXC/XT.COM notice; spread widening; volume decay
Issuer insolvency	CRITICAL	Chain, token and node-sale revenue all depend on the listed parent surviving.	Sukuk default; winding-up petition; auditor qualification
Dilution	HIGH	53% of max supply unissued; node/token sales are a revenue line, so issuance is a business model, not an accident.	New tranche announcements; FDV/supply divergence
Concession non-renewal	HIGH	RTD suspension already demonstrates the state will withdraw.	Further agency suspensions; contract terminations
Litigation / enforcement	HIGH	MACC and police probes create personal and corporate exposure.	Charges; travel bans; asset freezing
Notional valuation collapse	MEDIUM	FDV cannot be realised at quoted prices.	Any large holder attempting exit

Table 8 — Risk register, severity-ranked. The top two are issuer-side, not market-side.

10. Indicators to Monitor

Sukuk rating actions — a downgrade to default is the cleanest insolvency trigger.

Bursa announcements (7153) — litigation updates, auditor statements, capital-raising.

MACC / police case progression — charges convert uncertainty into a date.

MEXC and XT.COM listing status — delisting is the token's terminal event.

Token supply releases — any issuance against the 2.11B maximum.

RTD / JPJ and other concession reinstatements — the only genuine recovery catalyst.

FDV-to-volume ratio — currently ~119,000:1, a standing measure of how notional the valuation is.

11. Source Register

#	Source	Data used	Grade
1	stockanalysis.com/quote/klse/ZETRIX (30 Oct close)	Price RM0.065, mcap RM514.57M, 7.92B shares, 52w range, P/E, TTM revenue & net income	A1
2	CoinGecko /coins/zetrix (2 Nov)	Price, ATH/ATL, FDV, supplies, 30d/1y changes	A1
3	CoinGecko /coins/zetrix/market_chart 180d	Daily token series used for all return maths	A1
4	CoinGecko /coins/zetrix/tickers	Venue list, volume split, total 24h volume	A1
5	CoinGecko /coins/bitcoin/market_chart 180d	BTC benchmark for correlation/beta	A1
6	Google News RSS (en-MY) — The Edge, The Star, NST, Malay Mail, Malaysian Reserve, Malaysiakini, BusinessToday	Event datelines 24 Aug – 30 Oct 2026	B2 (multi-outlet)
7	In-house intel store (malaysia/classified) — FMT/Bernama captures	28 Aug crash detail, UMA query, margin call, 2 Sep stake sales, 24–22 Sep price levels	B2
8	chainsentry-pipeline EA-50 roster (T2.5 Zetrix row)	Prior distressed classification; RM314m seizure note; MARC negative watch	A2 (internal, sourced)
9	frankfurter.app USD/MYR	FX 4.057 for cross-currency comparison	A1

Table 9 — Source register. Press items are cited by outlet and dateline; no claim rests on a single unattributed press line.

12. Limitations

No access to primary filings. Bursa announcements and the audited accounts were not retrieved directly; the event chain is reconstructed from dated press, which is B2. Quarterly figures are as reported by media, not re-derived from statements.

Token float is opaque. With circulating supply reported as zero, neither market cap nor true float-adjusted valuation can be computed. FDV is used as a ceiling.

Correlation is not causation. The 0.034 R^2 establishes that BTC does not explain ZTX; it does not by itself prove the news mechanism, which is an inference from timing coincidence across two independent event windows.

Distressed equities are non-stationary. Betas and correlations computed through a solvency event have limited predictive value; treat Table 5 as descriptive, not a model.

Venue data quality. MEXC and XT.COM volume figures are self-reported and may include incentivised trading.
